

# Search For The Perfect Interface Online

Posted on April 9, 2015

The internet is a major source of information that most people use on a daily basis. In just a matter of seconds people can find just about any type of information they are searching for. By typing in just a few key words people can look up the specific domain name information they desire. There are certain websites that are set up specifically to help people search for the information they are looking for.

Using a search specific website can be convenient for many people. These sites are set up to bring up the most popular search results for a specific topic, instead of just bringing up random information. People commonly use these types of sites when they are looking for a specific domain name or are trying to find a particular business name. The sites are helpful because they also give people alternative options in addition to what they were looking for originally.

One popular website that people use is the whois service. People go to the website and type in the key phrase whois, followed by who they are looking for. A list of results will then be displayed and a person can choose the correct information they need from that list. A popular search on this site is whois json api. The result is a list of websites associated with the application programming interface (API) and a JSON page maintained by four editors that is done in Java Object Notation (JSON).

One thing that is nice for people is that there is no charge for the whois service. This gives people the opportunity to look up information that will be useful to them without having to pay for the service. When a person searches [whois json api](#) the results give people a number of pages to choose from that offer a great deal of technical information. A person will need to decide for themselves which page offers the information that will be the most useful to them.
